EXAM# TYPE/EXAM  
001046825 CT/CT SINUSES CORON. W/O CONTRA

EXAMINATION: CT coronal sinuses.

INDICATION: Chronic sinusitis.

TECHNIQUE: Contiguous 2.0 mm coronal images of the paranasal sinuses were obtained without IV contrast enhancement. Bone window and soft tissue window images were reconstructed.

COMPARISON: None.

FINDINGS:

Frontal: The frontal sinuses are underdeveloped. There is near complete opacification of both frontoethmoidal recesses.

Ethmoid: There is extensive opacification of the anterior and posterior ethmoid air cells

Maxillary: There is near complete opacification of both maxillary sinuses, with complete blockage of both ostiomeatal units and accumulated aerosolized secretions. No Haller air cells, paradoxical curvature of the middle turbinates or concha bullosa are present.

Sphenoid: The sphenoid sinuses are not developed. There is no evidence for aberrant carotid arteries.

Nasal septum: The visualized nasal septum is minimally deviated, convex to the right.

IMPRESSION:

MULTI-COMPARTMENTAL SINUS INFLAMMATORY DISEASE, WITH COMPLETE BLOCKAGE OF BOTH OSTIOMEATAL UNITS.
